

1152. Analyze User Website Visit Pattern Premium

Solved ●

Medium Topics Hint

You are given two string arrays `username` and `website` and an integer array `timestamp`. All the given arrays are of the same length and the tuple `(username[i], website[i], timestamp[i])` indicates that the user `username[i]` visited the website `website[i]` at time `timestamp[i]`.

A **pattern** is a list of three websites (not necessarily distinct).

- For example, `["home", "away", "love"]`, `["leetcode", "love", "leetcode"]`, and `["luffy", "luffy", "luffy"]` are all patterns.

The **score** of a **pattern** is the number of users that visited all the websites in the pattern in the same order they appeared in the pattern.

- For example, if the pattern is `["home", "away", "love"]`, the score is the number of users `x` such that `x` visited `"home"` then visited `"away"` and visited `"love"` after that.
- Similarly, if the pattern is `["leetcode", "love", "leetcode"]`, the score is the number of users `x` such that `x` visited `"leetcode"` then visited `"love"` and visited `"leetcode"` **one more time** after that.
- Also, if the pattern is `["luffy", "luffy", "luffy"]`, the score is the number of users `x` such that `x` visited `"luffy"` three different times at different timestamps.

Return the **pattern** with the largest **score**. If there is more than one pattern with the same largest score, return the lexicographically smallest such pattern.

Note that the websites in a pattern **do not** need to be visited *contiguously*, they only need to be visited in the order they appeared in the pattern.

Example 1:

Input: `username = ["joe","joe","joe","james","james","james","james","mary","mary","mary"], timestamp = [1,2,3,4,5,6,7,8,9,10], website = ["home","about","career","home","cart","maps","home","home","about","career"]`

Output: `["home","about","career"]`

Explanation: The tuples in this example are:
`["joe","home",1]`, `["joe","about",2]`, `["joe","career",3]`, `["james","home",4]`, `["james","cart",5]`, `["james","maps",6]`, `["james","home",7]`, `["mary","home",8]`, `["mary","about",9]`, and `["mary","career",10]`.
The pattern `("home", "about", "career")` has score 2 (joe and mary).
The pattern `("home", "cart", "maps")` has score 1 (james).
The pattern `("home", "cart", "home")` has score 1 (james).
The pattern `("home", "maps", "home")` has score 1 (james).
The pattern `("cart", "maps", "home")` has score 1 (james).
The pattern `("home", "home", "home")` has score 0 (no user visited home 3 times).

Example 2:

Input: `username = ["ua","ua","ua","ub","ub","ub"], timestamp = [1,2,3,4,5,6], website = ["a","b","a","a","b","c"]`

Output: `["a","b","a"]`

Constraints:

- `3 <= username.length <= 50`
- `1 <= username[i].length <= 10`
- `timestamp.length == username.length`
- `1 <= timestamp[i] <= 109`
- `website.length == username.length`
- `1 <= website[i].length <= 10`
- `username[i]` and `website[i]` consist of lowercase English letters.
- It is guaranteed that there is at least one user who visited at least three websites.
- All the tuples `(username[i], timestamp[i], website[i])` are **unique**.
